

PWD Control

PWD Control Id	17
Crop ID	Niger Seed
Pwd Name	Ozonium wilt
Pwd Type	Disease
Causal Agent	Ozonium texanum var. parasiticum Thirum.
Symptoms	Necrotic lesions develop on stem of well grown plants near the soil level. Whitish fungal mycelium grows on these necrotic areas under high humidity and the branches, leaves, inflorescence etc become soft and start rotting. The diseased stem, breaks.
Control	Treating the seed with Thiram at the rate of 2 g/kg seed before sowing is quite effective to control the disease.
